

# NEED HELP CONNECTING TO THE INTERNET?

There is only **ONE** way to properly setup a router. Incorrectly connecting a router to the residential network will automatically deactivate the network port in your room. In that case, you will be required to wait up to 72 hours for a technician to re-enable the port.

This **WAN** port may be labeled as WAN, Internet, Modem, DSL, Cable, or ISP. Connect this port directly to the network port on the wall.

These **LAN** ports are for connecting computers, game consoles, and other devices.

## IMPORTANT!

Do not connect a numbered **LAN** port to the network port on the wall. The network port in your room will be automatically disabled.

## NEED MORE HELP?

Please read the documentation provided by the router manufacturer or visit their support website.
